A pertinent but relatively unexplored question is how the introduction of a project culture affects social relations and who assumes leadership, how do they legitimise their position and which networks and alliances do they develop and rely on. To address this is to acknowledge that humanitarian assistance to IDPs and other conflict-affected groups does more that meeting basic needs; it alters and shapes the structures, relationships and moralities of societies and communities emerging from conflict. To summarise, researchers should acknowledge:

- the heterogeneity of populations with different identities and positions that is obscured by the homogenous category of ‘IDP’
- that IDPs – like all other social groups – consider their options and act strategically to achieve their individual goals
- the importance of not merely explaining ‘why’ and ‘how’ IDP populations have come to their present state but also asking ‘what next?’
- that IDPs are not necessarily rooted to home: many wish to move on to other places, other possibilities and new lives
- the need to better understand who assumes leadership positions in post-conflict communities, how they legitimise their position and which networks and alliances they develop and rely on
- the importance of analysing development of new leadership structures and understandings of authority and what these say about ideas of community and society
- the need to think about differences between policy-directed research and basic research.

Social science and forced migration: some methodological and ethical issues

by Karen Jacobsen

There are a number of key methodological and ethical problems confronting social scientists doing field work in humanitarian situations, where the subjects of the research are directly affected by conflict and displacement – whether they are refugees, IDPs or hosts.

Is policy-driven research based on unsound and uncritiqued methodology? Could the subsequent policy conclusions which are generated therefore be flawed?

The problem of inaccurate and unsubstantiated assertions reflects a key problem in social science research in the humanitarian field, namely the methods used to conduct empirical research. Unlike more traditional social science studies, most humanitarian ‘field’ research has not been subjected to critique of its methods. In all sound research it is important that the methods used to obtain information and data be clearly explained in order to make it possible to replicate them and thereby validate findings. But in much humanitarian field research, key details about the approach are never revealed. Among the missing details not generally provided are: how many people were interviewed, by whom and under what circumstances; how the subjects were identified and selected and how translation issues were handled.

Methodological weaknesses and ethical problems

- Too many interviews – not enough data sets

Much of the published research on refugees and IDPs is based on data that has been collected using fairly unstructured interviews in a small-scale setting. Although in-depth interviews have given us a rich and useful store of descriptive and anecdotal data, they do not yield a sufficiently representative sample of the population to allow us to test competing hypotheses and causal relationships using statistical analysis. Aside from camp surveys, there are currently very few data sets based on large-scale surveys conducted by social scientists of self-settled refugee or IDP populations (i.e. those living outside camps), either in rural or urban areas. Existing surveys tend to focus on public health or nutritional issues. One particularly understudied population is urban refugees and IDPs.

- Missing control groups

Much social science research on refugees lacks any kind of control
group, making it difficult to assess the extent to which refugee status is the problem or whether other factors are causing the variance. For example, a common research topic is the study of security problems in refugee camps, yet few studies are designed in such a way as to compare the security problems of refugees in camps with those living outside camps or with those of the host community.

- **Representativeness and bias**

Many social scientists in the field use a ‘snowball’ sample approach. Unlike a random sample, where everyone in the target population has an equal chance of being in the sample, in a snowball sample the subjects are more likely to be drawn from a particular segment of the community, and are likely to be similar in certain ways – church-goers and their friends, for example, or those who are beneficiaries of an NGO. The sample will therefore be biased.

- **The problem of bias and construct validity**

Construct validity refers to the strength and soundness of the variable we are investigating. The conversation-like tone of in-depth interviews can potentially prompt particular responses, or inadvertently direct the answers, an unconscious process often difficult to avoid even by trained researchers. This potential problem is even more salient in participatory rural appraisal (PRA) techniques that are popular among field researchers. Many argue that PRA should be used as only one among a variety of measures – but in much reported field research it is the only one.

- **Determining the size of the target population**

Knowledge of the size of the target population is important in generating a proper sample. In the case of urban refugees and IDPs, no studies have yielded an accurate count in Africa. At best there are rough estimates.

- **Addressing these problems – the difficulties of studying self-settled refugees**

- **The problem of access**

The problem of access to refugees means that most researchers work in camps, which present a more logistically manageable area, omitting from their study those refugees/IDPs who don’t live in camps yet who may be the majority. The difficulties of exploring the range of views held by the women in a community, for example, is particularly well known; this is also true for other more ‘hidden’ social groups, including the poor and those living in remote areas.

- **Using local researchers**

Western researchers work with local researchers because it is widely believed that this yields better results. While it is likely that the use of local researchers can increase the reliability and validity of data, there may be ethical and methodological problems issues involved, such as translation inaccuracies or – when refugee assistants are used – biased responses.

Political or security problems may arise for refugee assistants/local researchers. When refugees are interviewed the information they reveal may be used against them either in the camp or in their areas of origin. In group discussions, a method commonly used by researchers, there can be no confidentiality; what may be inadvertently revealed cannot be fully controlled even by diligent researchers.

- **Making our work more relevant**

As social scientists working in the humanitarian field, we have a duty to be honest researchers, conducting methodologically sound research while doing our best to confront the ethical problems that all fieldwork encounters. We need to:

- be more careful about making claims about representativeness and about representation within the community
- be more careful about construct validity
- write more clearly, use less jargon and avoid over-researched topics and places
- use common definitions of concepts
- be aware of political realities/incentive structures.

www.idpproject.org

The Global IDP Project provides public information on conflict-induced displacement, training on the UN Guiding Principles on Internal Displacement and advocacy for displaced people. After six years of monitoring internal displacement worldwide the Project has become a leading information source and centre of expertise on IDPs. The Project was initiated by the Norwegian Refugee Council, an organisation that has actively promoted improved protection and humanitarian assistance to IDPs for over a decade. When the UN Emergency Relief Coordinator assumed greater responsibility for IDPs in 1998 he was also charged with promoting the collection and dissemination of information on IDPs. To support this function the UN Inter-Agency Standing Committee formally asked the Norwegian Refugee Council to develop and maintain the Global IDP Database.
